

Christmas crackers

Why seek out three kings of Orient when you can take wise advice from us? Ajith Ram tests 12 PC systems for **games, office or home, some at prices that won't sleigh you.**

Christmas is that time of year when many people consider treating themselves and their family to a new PC. There's a wealth of choice and specifications around, so we have divided our group test into three categories to help you find exactly what you want.

➔ **The first category** includes four games systems. As this is a season when there's more time available in which to play games, and the largest number of games titles are released, it makes sense to test a few machines which could fit the bill as a "perfect" games machine. Our specification included a powerful graphics card, large monitor, good sound card, speakers and games bundle, for a cost of around £1,500 (inc VAT).

➔ **Our second category** is made up of mid-range systems that will run office applications, an accounts package and multimedia programs and which can be used to surf the net. In other words, the family PCs. For around £1,000 (inc VAT) we asked that these systems be equipped with a good graphics card, sound card, speakers and a decent monitor.

➔ **Our third category** consists of the budget-priced PCs. Typically costing around £700 (inc VAT) these economically priced systems are good for those on the lookout for a second home PC and are a good choice for college students on a tight budget. We weren't looking for flashy extras, just good, solid components at a fair price.

Armari NBX-350 95

Games system

This machine has the same powerful graphics card as the Carrera system [below]. Housing the Riva TNT chipset, the Diamond Viper V550 supports Microsoft's DirectX 6 API and is the fastest 3D accelerator on the market [PCW November '98, p198]. With 16Mb RAM, the Viper card can handle resolutions up to 1920x1600 and is supported by a 350MHz PII

processor. The Armari system has a Creative Labs DVD-ROM, but the MPEG-2 decoding is handled by the processor and Zoran's

software DVD player. Since the Riva TNT chipset does not support motion compensation, the software playback may result in dropped frames. Audio is provided by Diamond Multimedia's Sonic Impact S90. Based on Aureal Semiconductor's Vortex chipset, the S90 is a true gamer's card. Supporting Aureal's proprietary A3D API and Microsoft's DirectSound, it is one of the few sound cards able to reproduce true surround-sound using just two speakers. The A3D API is supported in popular games.

The NBX-350 is housed in one of the largest tower cases we have seen, making its interior seem tidy and spacious. The Asus motherboard has two PCI slots free. There are also two 3.5in and 5.25in bays free, making the system easy to upgrade. The 9.1Gb hard disk is big enough to cope with demanding desktop storage requirements.

The Armari's performance in our SYSmark test was above average. Its Final Reality test results were equally good, due to its powerful graphics card.

The 17in Iiyama S7029T monitor supports resolutions up to 1600x1200 but here it has a lower refresh rate than the ADI 5GT monitor. It provides sharp images and crisp colours and the controls are easy to manipulate.

PCW DETAILS

Price £1,498 (£1,275 ex VAT)

www.armari.com

Good Points Powerful graphics card. DVD-ROM.

Bad Points Average speakers. No hardware MPEG-2 decoder.

Conclusion A good gaming system that is easily upgradeable.

Build Quality	★★★★
Performance	★★★★
Value for Money	★★★
Overall Rating	★★★

Carrera Power Pro 2-450

Games system

Built around Intel's 450MHz processor, the Power Pro is the fastest system in this group test with a SYSmark test score of 181. The heart of a games PC is the graphics card. The Power Pro delivers its knockout punch through the Diamond Viper V550, *Editor's Choice* in our November '98 graphics card group test. Built around nVidia's new Riva TNT chipset and boasting a fill rate of 180 million pixels/sec, the V550 is faster even than a dedicated 3D accelerator like the Voodoo2. The Riva TNT

(Twin Texel), as its name

implies, is able to read two pixels in a single clock cycle. This gives it an advantage in games, now coming on to the market, which utilise multi-texturing. The high fill rate also gives the V550 the ability to deliver smooth frame rates. A graphics card with such brute power requires a CPU which can keep pace with it. The 450MHz Pentium II is the fastest on the market and is an excellent companion to the Diamond card. Gamers who want even more processing power might consider overclocking the CPU, although this is a risky operation. The Carrera system also has the most powerful sound card on the market. Equipped with a RISC processor as powerful as a Pentium 133, the SoundBlaster Live! is a gamer's dream. The Power Pro comes with four surround speakers and a subwoofer, and Carrera has included a driving wheel with force feedback.

The 17in LG77T monitor is able to support a refresh rate of 75Hz at 1280x1024. Built using shadow

mask technology, the LG monitor has a 0.28mm dot pitch. Although the screen was consistently bright and the images sharp at all resolutions, some of the colours in the blue region of the visible spectrum were washed out. The pushbutton controls are easy to access and manipulate.

Price £1,550 (£1,319 ex VAT)

Contact Carrera 0171 830 0486

www.carrera.co.uk

Good Points Excellent graphics and sound.

Bad Points None.

Conclusion A true gaming system.

Build Quality	★★★★
Performance	★★★★★
Value for Money	★★★
Overall Rating	★★★★

Gateway G6-350

• Games system

The first gaming system Gateway sent us had a faulty motherboard. The replacement came with an Intel Tolstoy BX motherboard with a 350MHz PII processor. To provide 3D acceleration for games, an STB Blackmagic Voodoo2 card was included. Although it's a good 3D accelerator with support for single-pass multitexturing, it's not quite as powerful as the Viper V550.

Also, the Voodoo2 chipset does not support advanced features like specular lighting and bump mapping. A SoundBlaster 64 provides audio via a pair of Altec Lansing speakers. Although it's a PCI sound card, the SB 64 is not as impressive as the SB Live!. Its positional 3D sound output from the two speakers is a feeble attempt at true surround sound.

The Gateway system has a DVD-ROM but no MPEG-2 decoder card. Even with the power of the 350MHz CPU, software DVD playback results in dropped frames. One reason for this is that the main STB Velocity display card does not support motion compensation. The PC has a large 10.2Gb hard drive, big enough to keep the most avid application-hoarder happy for a while, and an Omega Zip drive. The G6-350 was the only system that came in a desktop case. Smaller than the tower models, the interior was slightly cramped. With two free PCI slots and a single ISA slot, the Gateway system is not as easily upgradeable as others in the group.

The 17in Gateway monitor is not as good as the LG77T nor the ADI 5GT. Its refresh rate of 1024x768 is an acceptable 85Hz but this falls to a poor 60Hz at 1280x1024. Its colour fidelity and image sharpness are on a par with others, though.

PCW DETAILS

Price £1,397 (£1,189 ex VAT)

www.gateway.com/uk

Good Points Powerful. Dedicated 3D graphics card. DVD-ROM.

Bad Points Average sound card. No hardware MPEG-2 decoder.

Conclusion Some good components, but not the most powerful gaming PC.

Build Quality	★★★★
Performance	★★★★
Value for Money	★★★★
Overall Rating	★★★★

Mesh Elite Terminator 350

• Games system

Unlike Armari, Carrera and Gateway, Mesh supplied a PC with an AMD processor. Running at 350MHz, the K6-2 is an excellent choice for a gaming system. This is because its 27 3D Now! instructions speed up floating-point calculations, giving it an edge over a Pentium II of the same speed. The Hercules

Terminator Beast graphics card, although fearsome in name, is not as powerful as the Diamond

Viper V550, but in games which do not use multitexturing it is still faster than a dedicated 3D accelerator like the Voodoo2. The Savage 3D chipset on which it is built is also the only one that supports texture compression, part of Microsoft's new DirectX 6 API.

The Teac PowerMax multimedia system is another impressive part of the Mesh PC. Consisting of five speakers and a dedicated subwoofer, the PowerMax is capable of reproducing true Dolby Pro Logic surround sound. Unfortunately, it lacks support for superior Dolby AC-3, so users will not be able to hear DVD movie soundtracks in their full glory. The AWE 64 Gold, although one of the best ISA sound cards ever produced, is not as powerful as its successor, the SoundBlaster Live!. It also lacks support for surround sound.

The Mesh system is well built. All the wires and IDE cables are kept well out of the way and the components are easily accessible.

It has three PCI slots and one free ISA slot.

The 17in ADI 5GT monitor is built using Sony's Trinitron technology. With a 0.26mm dot pitch, this monitor supported the highest refresh rates in this group test. Its picture quality and colour fidelity are among the best.

Price £1,500 (£1,275 ex VAT)

Contact Mesh 0181 208 4700

www.meshplc.co.uk

Good Points Powerful graphics card. DVD-ROM with MPEG-2 decoder. Excellent speakers.

Bad Points Average sound card.

Conclusion A powerful gaming system that deserves consideration.

Build Quality	★★★★
Performance	★★★★
Value for Money	★★★★
Overall Rating	★★★★

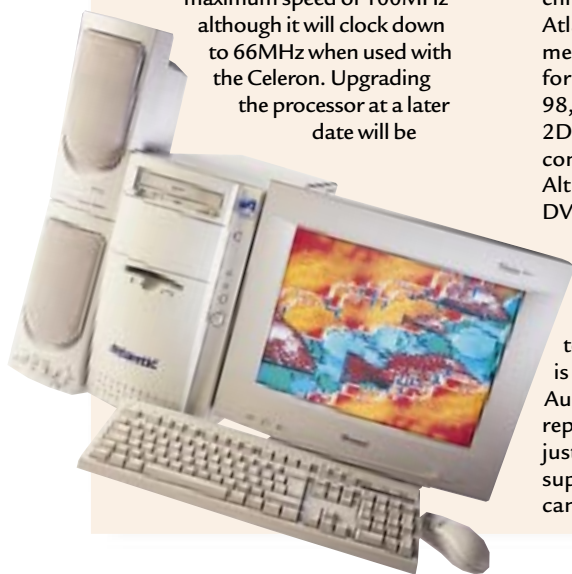

Atlantic Pro 98

• Mid-range system

The Atlantic Pro 98, like the Tiny Family Bonus system [p148], houses the 333MHz Celeron processor with 128Kb of L2 cache and comes with a BX motherboard. With its capacity to handle bus speeds of up to 100MHz, this motherboard can hold processors faster than 500MHz. Atlantic has included 64Mb of PC 100 SDRAM. This memory runs at a maximum speed of 100MHz although it will clock down to 66MHz when used with the Celeron. Upgrading the processor at a later date will be

easy, as the motherboard and RAM are ready to run faster and so give a big performance boost. The 6.4Gb hard drive in the Pro 98 is larger than the one in Tiny's system and is adequate for a family PC. There are three PCI slots free.

The ATI Xpert 98 graphics card is based on the 64-bit Rage Pro Turbo chipset. Even though the card in the Atlantic system has only 4Mb of memory, it is upgradeable to 8Mb for a little more money. The Xpert 98, in addition to being a good 2D/3D card, also supports motion compensation for DVD playback. Although Pro 98 does not have a DVD-ROM, users who intend to upgrade can mobilise the help of the graphics card for software playback, provided the processor is powerful enough to support it. The Terratec Xlerate is a PCI sound card which supports Aureal's A3D API. This enables it to reproduce surround sound through just two speakers. Due to its support for 64 voices, the Xlerate can also function as a MIDI card.

The 17in Hansol 700 monitor supports resolutions up to 1280x1024 but its refresh rate at that resolution is a flickery 60Hz. At lower resolutions the refresh rate rises to 85Hz. Its screen is not as bright and clear as the ADI and Iiyama monitors in this group test.

PCW DETAILS

Price £997 (£899 ex VAT)

Contact Atlantic 0990 134725

www.atlanticsystems.com

Good Points Easily upgradeable. Well constructed.

Bad Points Average monitor.

Conclusion An easily upgradeable system with some good components.

Build Quality	★★★★
Performance	★★★★
Value for Money	★★★★
Overall Rating	★★★★

Dan Xplora II Plus

• Mid-range system

When Intel released the original Celeron processor, it was heavily criticised for its lack of L2 cache and consequent poor performance in office applications. However, its successor, the 333MHz processor with 128Kb L2 cache, is proving popular with system vendors. The Dan Xplora, like four other systems in this group test, comes with this CPU. It has a motherboard based on the BX chipset, as do the systems from Tiny [p148] and Atlantic [above].

Currently running at 66MHz, the speed of the frontside bus can be increased to 100MHz if a faster processor, such as a Pentium II 350, is inserted. Its ability to accommodate CPUs beyond 500MHz makes it the ideal platform for upgrading.

This Dan system is well built, with ample ventilation. Its two free DIMM slots, four PCI slots and two 5.25in bays make it easy to upgrade. The ATI All-in-Wonder Pro graphics card is built on the Rage Pro Turbo chipset. What differentiates this from the Xpert 98 is a high-quality TV tuner: in addition to being able to see a TV display on the monitor, users can capture the images as AVI or BMP files. However, the TV tuner does need a boosted signal to work properly.

The AWE 64 Value is an ISA sound card using the EMU1000 processor. Although it is able to support 64 voices simultaneously, its fidelity is not as high as the PCI Xlerate sound card. Also, it cannot reproduce surround sound through

two speakers. The Dan Hi-Fi speakers are very good quality.

The 15in CTX monitor handles refresh rates up to 85Hz at 1024x768 but this falls to a flickery 60Hz at its highest resolution of 1280x1024. Overall, this CTX monitor is not quite as good as the ADI Microscan 4P.

PCW DETAILS

Good Points Well constructed. Good graphics card.

Bad Points Average sound card.

Conclusion An easily upgradeable system, slightly let down by an average monitor.

Build Quality	★★★★
Performance	★★★★
Value for Money	★★★★
Overall Rating	★★★★

Mertec XM300-K2

Mid-range system

Although Intel has an overall market share of 85 percent, the budget PC market rests firmly in the hands of AMD. Its new K6-2 processor, with 27 hard-coded MMX-style instructions that speed up floating-point calculations, has been well received by system vendors.

Mertec's XM300 uses the 300MHz version of this processor.

The XM300 has 64Mb of RAM, of the 100MHz variety, which is enough for running Windows 98 applications without any major hiccups. The Mertec system additionally comes with 1Mb of cache on the motherboard. Although this is supposed to boost performance, it was not reflected in the system's SYSmark test score. The Millennium G200 graphics card is one of the most powerful around. Based on the Matrox 128-bit G200 chipset, the 8Mb Millennium is an excellent performer in 2D and 3D applications. It has a high RAMDAC of 250Hz and its memory can be increased to 16Mb. It also has motion compensation for DVD playback.

The 17in ADI 5P monitor is not as good as the costlier ADI 5GT. With a 0.28mm dot pitch, this shadow mask monitor supports a resolution of 1280x1024 at a flickery 60Hz. Its refresh rate increases to 85Hz at lower resolutions.

Good Points Well constructed. Good graphics and sound.

Bad Points Average performance.

Conclusion An easily upgradeable system.

Build Quality	★★★★
Performance	★★★
Value for Money	★★★★
Overall Rating	★★★

Tiny Family Bonus

Mid-range system

The Family Bonus system has Intel's latest 333MHz processor from the low-cost Celeron series. Unlike the original Celeron, which had no cache, the new processor has 128Kb of L2 cache running at the same clock speed as the processor. This makes it a good choice for running routine office applications like Word and Excel. Even though the Celeron has its own EX motherboard, Tiny has chosen a superior BX model, making the system easily upgradeable. The Microstar motherboard can handle frontside bus speeds of 66MHz and

100MHz, which means the buyer can upgrade to a faster PII processor. But to get a real performance kick, the RAM will also have to be upgraded, to PC100 SDRAM. The motherboard has three PCI and two ISA slots free.

The ATI 3D Charger graphics card uses an older Rage II chipset and has 4Mb of SDRAM. It's not as powerful as ATI's own next-generation cards, based on the Rage Pro chipset, but the 3D Charger is good enough for regular work. The 4Mb of memory is not upgradeable, though. Users who want high resolutions at better colour depths will have to replace the graphics card. The Yamaha sound card pushes sound out of two very stylish speakers and its fidelity is above average.

Living up to its name, the Family Bonus comes with three PC peripherals: the Umax Astra 610P scanner (Editor's Choice in our September '98 group test), the Epson Stylus Color 300 printer and the Fuji DX-5 digital camera with

4Mb of Flash memory. The Tiny system is certainly value for money.

The 15in Tiny monitor does not support resolutions beyond 1024x768, and at that resolution its refresh rate falls to 65Hz. The images have good clarity, though, and the controls are easy to access.

PCW DETAILS

Price £1,056 (£899 ex VAT)

Contact Tiny 0800 821333 www.tiny.com

Good Points Easily upgradeable. Free scanner, printer and digital camera.

Bad Points Average monitor.

Conclusion A well built system that is excellent value for money.

Build Quality	★★★★
Performance	★★★
Value for Money	★★★★★
Overall Rating	★★★★

Dabs Direct Atlantis Home Value

Budget system

As the Dabs Direct system emerged from its box, we heard a metallic clang inside the ATX case. Opening up the system, there were unidentifiable bits of metal at the bottom of the case which could have damaged the components.

The Atlantis Home Value is not such good value for money as the others in this group, the main reason being the 266MHz Celeron processor (the original model Intel launched in early 1998).

With no L2 cache and a slower clock speed than the 300MHz version, this CPU performs poorly in business applications (see its low SYSmark score, p162). Dabs has chosen an Abit 440LX motherboard for the Celeron. These motherboards have a reputation for being stable platforms for over-clocking, and due to the absence of L2 cache, the original Celeron is quite tolerant to this. The Atlantis system has only a tiny 2.1Gb hard drive and this limited storage could easily become filled.

The construction of the Dabs system is not as tidy as the Elonex PC [below]. The wires and IDE cables are a tangled web, preventing easy access to the components, but at least it is well ventilated. And, in addition to the free DIMM slot, there are three 5.25in bays free.

The graphics card is based on the S3 Virge chipset. Although a good performer in 2D applications, it is far less powerful than the ATI Rage Pro and Riva 128 processors. This chipset also has some well-known compatibility problems with a few popular PC components.

The 14in Belinea monitor has a poor refresh rate of 60Hz at 1024x768. Even at lower resolutions, the refresh rate does not rise beyond 75Hz. Image sharpness also suffers at its highest resolution.

PCW DETAILS

Price £699 (£595 ex VAT)

Contact Dabs Direct
0800 558866 www.dabs.com

Good Points Free bays for expansion. Easy to over-clock.

Bad Points Poor construction. Mediocre performance. Old components.

Conclusion A budget system worth consideration if no other can be found.

Build Quality	★★★★
Performance	★★★
Value for Money	★★★
Overall Rating	★★★

Elonex MLX-6333/1

Budget system

The original Celeron processor failed to make an impression but its successor, with 128Kb cache, has fared better. The Elonex system comes with the 300MHz version of this processor. With its L2 cache running at the same core speed as the processor, the new Celeron is only slightly slower in office applications than a PII of the same speed. Its floating-point engine is identical to that of a PII and, with the higher cache

speed, it is a slightly better choice than PII's clocked at the same speed for running games and multimedia applications. The Celeron comes on an EX motherboard. The EX chipset was specially designed as a low-cost solution to hold the Celeron and has a frontside bus speed of 66MHz. Although adequate for running the Celeron, the PC is not as easily upgradeable as those with BX motherboards. The system is very well built and is easily upgradeable as there are three free slots.

The Diamond Viper V330 graphics card is based on the 128-bit Riva 128ZX chipset. It has 8Mb of SDRAM and is a good performer in 2D and 3D applications. The V330 supports DirectX and OpenGL APIs.

Unlike the other systems in this group, the MLX has an on-board sound card. And, the Yamaha YMF 715 chipset fully supports the DirectSound API, so with

high-quality audio output it's a good component to be included with this budget PC.

The 14in Elonex monitor is the best small monitor in this group test. It has excellent colour fidelity and image sharpness, and sustains a high refresh rate of 120Hz at 1024x768.

PCW DETAILS

Price £699 (£595 ex VAT)

Contact Elonex 0181 452 4444
www.elonex.co.uk

Good Points High-quality construction. Excellent monitor.

Bad Points Motherboard cannot take Pentium II processors.

Conclusion A well-built budget PC with all important components.

Build Quality	★★★★★
Performance	★★★★
Value for Money	★★★★
Overall Rating	★★★★★

Linear Vantage XL

Budget system

Proving the value of Intel's low-cost processor yet again, Linear's Vantage XL system comes with the 300MHz version of the new Celeron. With 128Kb cache on the processor itself, it is an excellent choice for a budget PC. With performance on office applications only slightly less than a Pentium II of the same speed, the new CPU is good value for money. The Vantage system's 64Mb RAM comes in two modules, which is unfortunate as there are no DIMM

slots free for upgrading. The ATX tower case is rather small, making the interior feel crowded. The XL has a 32X CD ROM drive and a 4.3Gb hard drive. The latter is good enough for a low-priced system and is capable of coping with most routine storage needs.

The PCI version of the ATI All-in-Wonder Pro is included in Linear's system. Although the card has 8Mb of RAM, performance trails behind its AGP counterpart. This is partly reflected in the Linear system's low SYSmark and Final Reality scores. The

All-in-Wonder Pro uses the 64-bit Rage Pro chipset.

With the help of the powerful floating-point unit in the Celeron, the card provides good 3D acceleration. It has a built-in TV tuner and the ability to capture video in AVI format.

The Creative Labs Vibra 16S sound card is not the most vibrant on the market. Being an ISA model, it is capable of handling only 16 voices simultaneously and is

therefore not as good as the next-generation AWE 32 and AWE 64 models.

The 15in Relisys monitor has a 0.28mm dot pitch and supports resolutions as high as 1024x768 at a respectable 75Hz. Its controls are easy to access and image quality is excellent.

PCW DETAILS

Price £699 (£595 ex VAT)

Contact Linear Direct 0181 408 9888 (no URL)

Good Points Excellent monitor.

Bad Points Crowded interior. Mediocre performance. No free DIMM slots.

Conclusion A budget system with no special components.

Build Quality	★★★★
Performance	★★★
Value for Money	★★★★
Overall Rating	★★★★

Roldec Puma

Budget system

Advanced Micro Devices (AMD) processors appear in over 50 percent of budget PCs, so it is not surprising to find a powerful AMD processor at the heart of such a system as this. The Roldec Puma sports the 333MHz version of AMD's new K6-2 processor. The K6-2 has 27 3D Now! instructions on it which help to speed up floating-point calculations. If properly supported by the application, the

K6-2 can be more powerful than a

Pentium II of the same speed, which makes the Puma a good system for running office applications as well as multimedia programs.

The Diamond Viper V330 graphics card, with 4Mb of memory, uses the Riva 128 chipset. It is one of the few cards with optimised drivers to take advantage of the new 3D Now! instructions. Hence, it is a good companion to the AMD processor. New AMD and Cyrix CPUs run on Super Socket 7 motherboards. The Microstar motherboard in the Puma system has a frontside bus speed of 100MHz so Roldec had fitted 100MHz SDRAM, and it is able to handle processors faster than 500MHz. The Roldec Puma has a 4.5Gb hard drive and a claimed 40X CD-ROM. However, our tests show that the actual average speed of the Asus CD-ROM is only around 24X. The Sonic Impact S90 sound card is the latest from Diamond Multimedia. Using Aureal's Vortex chipset, the S90 is able to reproduce surround sound from two speakers.

The 15in ADI monitor, although smaller than the 5P and 5GT, has the same 0.28mm dot pitch and high image quality. It has a maximum resolution of 1024x768 at a respectable refresh rate of 75Hz.

PCW DETAILS

Price £699 (£595 ex VAT)

Contact Roldec Systems 01902 456464

PCW Labs Report

These results show, more than anything else, the need for a good processor when running 2D office applications. This is most clearly seen in the Armari and Carrera machines. Both have the same graphics card (a Diamond Viper V550 with 16Mb of graphics RAM) but the Armari had a slower processor (PII 350) and more system RAM (128Mb), while the Carrera had a PII 450 and just 64Mb of RAM. However, the processing power of the Carrera won through, suggesting that you do not need 128Mb of RAM to run Word and should instead go for the fastest processor you can. We were also disappointed to see the AMD processors doing so badly in comparison to both the PIIs and the Celerons.

In these tests, a good processor seems to have been secondary to the graphics card and RAM. The Armari and Carrera were very close both in 3D and overall scores. Not surprisingly, they both have the same graphics card with the same amount of graphics RAM. We can see the clear advantage of having 16Mb of graphics RAM compared to the 8Mb included in most of these systems. However, the extra RAM in the Armari seems to have made more of an impression in this test than in the 2D tests, almost catching the Carrera with its faster processor.

How we did the tests

We ran two sets of tests on the machines:

Final Reality to test graphics capabilities, and **SYSmark 98** to test the speed of the machines when running 2D office applications. The SYSmark test measures the speed of the PC running eight common office applications and the time it takes to perform a variety of tasks in each application. Each test is run three times to ensure consistent results. Performance depends on processor speed, RAM, graphics card and disk I/O. As the tests are based on business software packages, SYSmark scores accurately reflect how the

machine will perform in a real-world situation. Final Reality is a suite of tests designed to gauge the processing power of the 3D accelerator on your graphics card, 2D image processing and AGP. It runs under Windows 95/98 and DirectX 5 and uses a 3D engine developed by Remedy. It supports Direct3D and looks at how the graphics accelerator handles the kind of data it would have to process when you are playing a game. The visual appearance factors are weighted in importance and combined with the overall processing speed to produce an overall mark.

Editor's Choice

A Christmas **stocking-full** of PCs for all budgets.

Apart from a couple of exceptions, there are some factors common to all the systems in this group test. The quality of construction of these PCs is excellent. They have high-quality components and most are easily upgradeable. For instance, we were pleasantly surprised to find powerful 333MHz processors inside PCs costing less than £700. And, the vendors have included large hard drives, powerful graphics cards and good sound cards. Many of these systems would keep you happy for a long time to come.

➔ **In the games system category**, the **Carrera Power Pro 2-450** stands out. In addition to being a speed monster, the quality of its internal components far outstrips others. The SoundBlaster Live! audio card is a good example. With its four-speaker surround-sound output it is a perfect gamer's card, and its impressive MIDI synthesis and so turns the Carrera PC into a miniature home studio. Similarly, the fast 450MHz Pentium II processor is a good companion to the powerful Diamond Viper V550 graphics card. Carrera has also thoughtfully included a steering wheel with force feedback to cap a well-equipped gaming system.

➔ **In the £1,000 price bracket**, the **Tiny Family Bonus** system caught our eye. Tiny claims to be the UK's largest PC retailer and this system is representative of the company's dedication to the mainstream consumer market. While not lacking in quality components, as shown by the inclusion of the 333MHz processor and upgradeable motherboard, the Tiny PC has no less than three useful peripherals bundled free with it. The Umax 610P scanner is one of the best in its price range and came top in our scanners group test in the September '98 issue. The Epson Stylus Color 300 printer, although not that fast, produces decent-quality colour

images and text. The Fuji DX-5 digital camera has a decent image resolution of 640x480 and comes with a 4Mb flash memory cartridge.

➔ **The sub £700 budget PC** segment is one of the fastest-growing sections of the PC market. The Elonex MLX-6333/1, despite its rock-bottom price, does not skimp on any necessary component. With its 300MHz processor and a large 6.4Gb hard drive, this system's performance is actually better than that of many others costing far more.

Christmas is a time when buyers look for bargains. In the realm of PC sales, there is no better bargain than the **Tiny Family Bonus** system. Its build quality is as good as the best in this group test, and with three high-quality bundled peripherals, the Family Bonus system is excellent value for money. These factors, along with the Tiny's high upgradeability, make it a fitting choice for our **Editor's Choice** award. The Tiny PC, more than any other system, would be the ideal Christmas gift.

The Carrera and Elonex systems also deserve an honourable mention. While the former is a speed demon and a gamer's dream, the latter delivers high performance at an enticing price. For these reasons, the **Carrera Power Pro-2 450** and the **Elonex MLX-6333/1** are worthy winners of our Highly Commended awards.
